# C/S determination in soil

## Sample preparation

Dry the sample to constant mass at 105 °C (at least 1 hour).

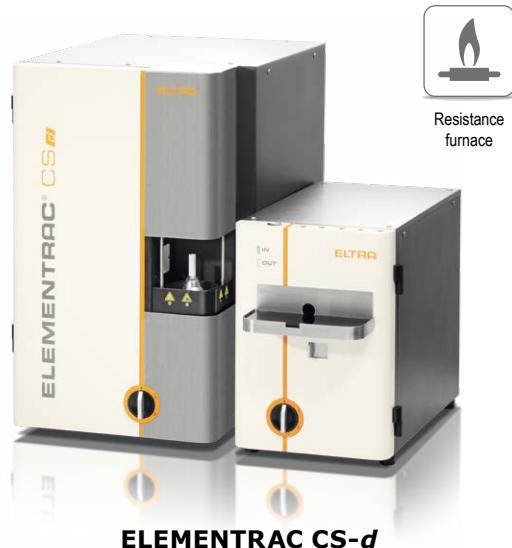

## Procedure

- Prepare and clean the ELTRA analyzer (e.g. exchange anhydride, filter, boat stop) and set the furnace temperature to 1350 °C
- Run at least three warm up samples (e.g. ELTRA 92511-3020) with a medium sample weight of 250 mg until the results are consistent
- Calibrate the system with a suitable calibration material (NIST or other):
  - (1) Weigh in 250 mg of sample in a porcelain boat (90160)
  - (2) Start analysis (F5 Button)
  - (3) Wait until baseline is stable  
(Look at message in ELEMENTS software and wait for green light at the resistance furnace)
  - (4) Load the sample into the furnace and wait until the PC calculates results
  - (5) Remove combustion boat

Repeat steps (1) – (5) at least three times;

Mark the results and use the calibration function in the software.

**-> Now start with the actual analysis.**
