C, S determination in steel rings

Sample preparation

Make sure that your sample is free from contaminations and inclusions which could influence the carbon determination. Pre-heat the crucibles at least for 1 h at 1000 °C. Let the crucibles cool down in a desiccator.

Procedure

- Prepare ELTRA analyzer (e.g. exchange anhydride, sodium hydroxide, platin catalyst if necessary); clean the combustion tube, brush, heat shield, dust trap
- Run three warm up samples (e.g. steel samples 92400-3050) with a minimum weight of 500 mg; add 1.7 g tungsten
- Calibrate the analyzer with suitable calibration material (NIST or other)

The procedure of analysis steel rings should be like this:

- (1) Weigh in a steel ring of approx. 1000 mg
- (2) Add 1.7 g of tungsten accelerator (90220)
- (3) Place the crucible on the pedestal and start analysis

Repeat steps (1) – (3) at least three times;

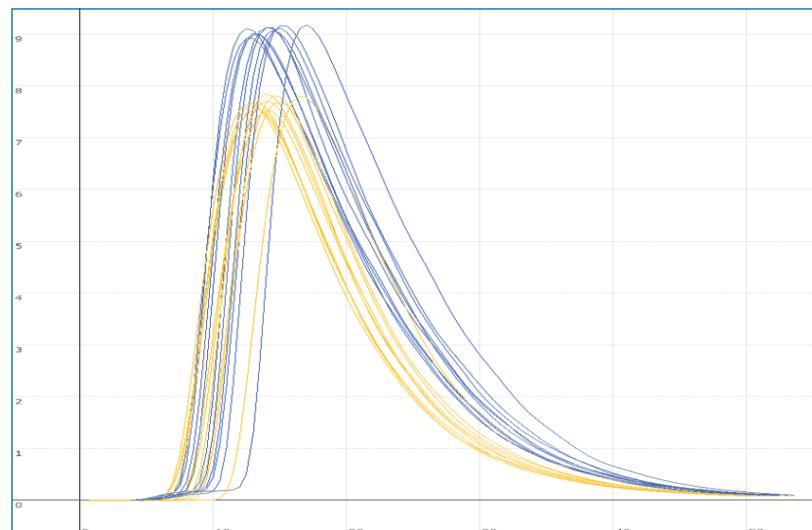

Mark the results and use the calibration function in the software.

-> Now start with the actual analysis.
